

SMOKE FREEZER...What is it?

Well, I am happy you asked! This is what we call a Smoke Freezer. Some call it a TEC Pipe, but basically it is a waterless pipe that takes hot smoke, cools, and filters it to the point where it leaves you with nothing but flavor and vapor to enjoy.

It really is the latest and greatest in the marijuana technology sector in a long time. The filters include an ash catcher, Tar Buster, and mouthpiece. The mouthpiece can hold traditional "Mouth Peace" type filters as well as a cotton ball. (Yes! This

works!) The Tar Buster is a coconut charcoal filter that will remove 98% of all tar, pesticides and other contaminants found in marijuana. The three components when used with the Smoke Freezer will lessen cough dramatically, even to the point of non-existence. If you need more filtering, then we suggest adding a second Tar Buster to the rig. That usually does it for most people. Since coughing and effects are first person, we do not make any guarantee to stop coughing all together. Our system drastically reduces cough for most people. If you already have a chronic smoker's cough, this device will not cure you, but it will make it easier for you to enjoy your sessions without the constant hacking and wiping snot from your nose.

The display temperature is reading the temperature that is inside the cooling chamber. It is NOT the temperature of the smoke coming out of the pipe. The temperature out of the pipe is usually between 60- and 70-degrees Fahrenheit. It must be that cold to offset the temperature of the hot smoke.

A feature of this device is the fact that according to Boyle's Law, when a gas is cooled, it compresses. This in turn will compress the hits and in turn use less product to get you medicated! You heard it right. Use less product to get you medicated. We have developed a blower attachment to be handsfree when using the device. It is currently being certified as a medical device.

The cleanup on it is easy too! You pour ¼ cup of 91 to 99% Isopropyl Alcohol into either the inlet or outlet of the device. Shake it up good and dump it out. Repeat once or twice until it comes out clear. Blow out any remaining isopropyl alcohol and let dry. Any remaining will evaporate. That's it! If your unit display does not get as cold as it did when you first got yours, it probably means you need to do a better job of cleaning it. The device is still getting to temperature, but because the temperature thermistor is most likely covered in resin, it will not register correctly. Make sure to clean it after each use and it will last.

The unit itself is a breakthrough in desktop technology. No more messing with ice, glycerin coils or water. None of them will cool as effectively as a Smoke Freezer. No more worrying about your pipe breaking because you set it down wrong, or it tipped over. It is a win-win when you purchase a Smoke Freezer.

When you buy a TEC Pipe, you are part of an evolving family. You have the option of upgrading to a larger pipe with full value towards the upgrade when you turn in your pipe. We also give you the option of changing your chassis to a different color or changing it to a different pipe. Turn in your pipe only, pay for the chassis and you have a new pipe for @\$100 + shipping. How cool is that? Come to www.lowcough.com and get the latest in smoking technology!
